

Business Analysis - RentSafeTO-evaluation-view.csv

How are Toronto rental apartment buildings scoring on RentSafeTO evaluations, which parts of the building are losing points, and what is likely to come next?

Bottom line: Volume +66.4% on the year before; average current_score +0.655; average entry_score +0.030; average envelope_score -0.212; average grounds_score +1.191; average interiors_score +0.786; average paperwork_score +2.285; average proactive_score +0.770; average refused_items +0.002; average stairs_score +1.973; average systems_score +0.108; average waste_score +1.249. [fact: measure.volume.change_pct, measure.current_score.change, measure.entry_score.change, measure.envelope_score.change, measure.grounds_score.change, measure.interiors_score.change, measure.paperwork_score.change, measure.proactive_score.change, measure.refused_items.change, measure.stairs_score.change, measure.systems_score.change, measure.waste_score.change]

No finding in this run cleared the confidence gate, so this brief recommends no action. 12 signals on watch, 1 question the data cannot answer.

What happened

- Row volume changed by +66.4% in the latest year (2,044 rows) against the year before (1,228 rows). A permutation test puts the chance of a gap this large arising from ordinary variation at $p = 0.369$. This did not clear the confidence gate because a gap this size could still be ordinary variation: watch it, do not act on it yet. [fact: measure.volume.change_pct, measure.volume.last12, measure.volume.prior12, measure.volume.change_pct.p]
- Average current_score moved from 89.6 in the year before to 90.2 in the latest year, a change of +0.655. A permutation test puts the chance of a gap this large arising from ordinary variation at $p = 0.021$. This did not clear the confidence gate because the gap is statistically clear, but the change is smaller than the size we require before recommending action: watch it, do not act on it yet. [fact: measure.current_score.change, measure.current_score.prior12_mean, measure.current_score.last12_mean, measure.current_score.change.p]
- Average entry_score moved from 94.8 in the year before to 94.8 in the latest year, a change of +0.030. A permutation test puts the chance of a gap this large arising from ordinary variation at $p = 0.922$. This did not clear the confidence gate because a gap this size could still be ordinary variation: watch it, do not act on it yet. [fact: measure.entry_score.change, measure.entry_score.prior12_mean, measure.entry_score.last12_mean, measure.entry_score.change.p]
- Average envelope_score moved from 86.2 in the year before to 85.9 in the latest year, a change of -0.212. A permutation test puts the chance of a gap this large arising from ordinary variation at $p = 0.638$. This did not clear the confidence gate because a gap this size could still be ordinary variation: watch it, do not act on it yet. [fact: measure.envelope_score.change, measure.envelope_score.prior12_mean, measure.envelope_score.last12_mean, measure.envelope_score.change.p]
- Average grounds_score moved from 88.4 in the year before to 89.6 in the latest year, a change of +1.191. A permutation test puts the chance of a gap this large arising from ordinary variation at $p = 0.001$. This did not clear the confidence gate because the gap is statistically clear, but the change is smaller than the size we require before recommending action: watch it, do not act on it yet. [fact: measure.grounds_score.change, measure.grounds_score.prior12_mean, measure.grounds_score.last12_mean, measure.grounds_score.change.p]
- Average interiors_score moved from 88.5 in the year before to 89.3 in the latest year, a change of +0.786. A permutation test puts the chance of a gap this large arising from ordinary variation at $p = 0.077$. This did not clear the confidence gate because a gap this size could still be ordinary variation: watch it, do not act on it yet. [fact: measure.interiors_score.change, measure.interiors_score.prior12_mean, measure.interiors_score.last12_mean,

measure.interiors_score.change.p]

- Average paperwork_score moved from 90.3 in the year before to 92.6 in the latest year, a change of +2.285. A permutation test puts the chance of a gap this large arising from ordinary variation at $p = 0.0001$. This did not clear the confidence gate because the gap is statistically clear, but the change is smaller than the size we require before recommending action: watch it, do not act on it yet. [fact: measure.paperwork_score.change, measure.paperwork_score.prior12_mean, measure.paperwork_score.last12_mean, measure.paperwork_score.change.p]
- Average proactive_score moved from 89.7 in the year before to 90.4 in the latest year, a change of +0.770. A permutation test puts the chance of a gap this large arising from ordinary variation at $p = 0.006$. This did not clear the confidence gate because the gap is statistically clear, but the change is smaller than the size we require before recommending action: watch it, do not act on it yet. [fact: measure.proactive_score.change, measure.proactive_score.prior12_mean, measure.proactive_score.last12_mean, measure.proactive_score.change.p]
- Average refused_items moved from 0.164 in the year before to 0.167 in the latest year, a change of +0.002. A permutation test puts the chance of a gap this large arising from ordinary variation at $p = 0.970$. This did not clear the confidence gate because a gap this size could still be ordinary variation: watch it, do not act on it yet. [fact: measure.refused_items.change, measure.refused_items.prior12_mean, measure.refused_items.last12_mean, measure.refused_items.change.p]
- Average stairs_score moved from 85.6 in the year before to 87.6 in the latest year, a change of +1.973. A permutation test puts the chance of a gap this large arising from ordinary variation at $p = 0.0001$. This did not clear the confidence gate because the gap is statistically clear, but the change is smaller than the size we require before recommending action: watch it, do not act on it yet. [fact: measure.stairs_score.change, measure.stairs_score.prior12_mean, measure.stairs_score.last12_mean, measure.stairs_score.change.p]
- Average systems_score moved from 94.4 in the year before to 94.5 in the latest year, a change of +0.108. A permutation test puts the chance of a gap this large arising from ordinary variation at $p = 0.757$. This did not clear the confidence gate because a gap this size could still be ordinary variation: watch it, do not act on it yet. [fact: measure.systems_score.change, measure.systems_score.prior12_mean, measure.systems_score.last12_mean, measure.systems_score.change.p]
- Average waste_score moved from 92.2 in the year before to 93.4 in the latest year, a change of +1.249. A permutation test puts the chance of a gap this large arising from ordinary variation at $p = 0.001$. This did not clear the confidence gate because the gap is statistically clear, but the change is smaller than the size we require before recommending action: watch it, do not act on it yet. [fact: measure.waste_score.change, measure.waste_score.prior12_mean, measure.waste_score.last12_mean, measure.waste_score.change.p]
- The most common decade_built value is '1960s', with 33.3% of rows. [fact: measure.decade_built.share.1]
- The most common district value is 'Toronto and East York', with 39.7% of rows. [fact: measure.district.share.1]
- The most common property_type value is 'PRIVATE', with 84.3% of rows. [fact: measure.property_type.share.1]
- The most common storeys_band value is '3-4', with 51.1% of rows. [fact: measure.storeys_band.share.1]
- The most common ward_name value is 'Toronto-St. Paul's', with 9.7% of rows. [fact: measure.ward_name.share.1]
- Left out of every figure above: 366 rows dated after the analysis window (the last month in the file (2026-09) holds the analysis date 2026-09-23, so it is not over yet). [fact: measure.rows_after_end]

Why

Nothing in this data explains the changes above, and no outside context was attached. That is not the same as having no cause: the file records what happened, not why.

What's next

- A forecast of monthly rows in RentSafeTO-evaluation-view.csv was fitted but is not offered: it could only be checked against 7 replayed months of 39 months of history, too few to trust. [fact: forecast.monthly_rows.next, forecast.monthly_rows.backtest.months, forecast.monthly_rows.history.months]

Do now

No finding in this run cleared the confidence gate, so this brief recommends no action.

Watch

- Monitor: Change in row volume, latest 12 months against the 12 before. Currently 66.45%. Not yet actionable. Gate: A 66% difference across 3,272 rows, but a gap this size would still turn up by chance in about 37 of 100 similar datasets -- we only call something settled at 5 in 100 or better. Worth tracking, not worth acting on yet. Re-check when this is true: More of the same pattern: it has held for 5 periods so far, and another 2 periods at this size, or a pull wider than 3,272 rows, would separate a real difference from noise. [fact: measure.volume.change_pct]
- Monitor: Change in average paperwork_score, latest 12 months against the 12 before. Currently 2.29 paperwork_score. Not yet actionable. Gate: Solid enough to keep an eye on, not enough to act on: the difference is 2.5% where we want at least 5% before changing anything. Re-check when this is true: To turn this into a recommendation: the gap would have to widen to about 5%. [fact: measure.paperwork_score.change]
- Monitor: Change in average stairs_score, latest 12 months against the 12 before. Currently 1.97 stairs_score. Not yet actionable. Gate: Solid enough to keep an eye on, not enough to act on: the difference is 2.3% where we want at least 5% before changing anything. Re-check when this is true: To turn this into a recommendation: the gap would have to widen to about 5%. [fact: measure.stairs_score.change]
- Monitor: Change in average refused_items, latest 12 months against the 12 before. Currently 0 refused_items. Not yet actionable. Gate: A 1.4% difference across 3,272 rows, but a gap this size would still turn up by chance in about 97 of 100 similar datasets -- we only call something settled at 5 in 100 or better. Worth tracking, not worth acting on yet. Re-check when this is true: More of the same pattern: it has held for 4 periods so far, and another 2 periods at this size, or a pull wider than 3,272 rows, would separate a real difference from noise. [fact: measure.refused_items.change]
- Monitor: Change in average waste_score, latest 12 months against the 12 before. Currently 1.25 waste_score. Not yet actionable. Gate: Solid enough to keep an eye on, not enough to act on: the difference is 1.3% where we want at least 5% before changing anything. Re-check when this is true: To turn this into a recommendation: the gap would have to widen to about 5%. [fact: measure.waste_score.change]
- Plus 7 further signals on the watch list, not listed on this page.

What we cannot answer

- The data cannot support this claim: Forecast of monthly rows in RentSafeTO-evaluation-view.csv for 2026-09. Why: The method could only be replayed over 7 months, fewer than the 12 we require to judge it. What would settle it: A longer history, so at least 12 months can be held out. [fact: forecast.monthly_rows.next]

Every figure above carries its unit and a fact id. The full evidence trail -- the query or formula behind each figure, and whether it was re-run -- is in the full brief and the evidence ledger.
